

If the system is type approved, it shall be possible to verify that the system to be delivered represents the type approved physical and logical topology.

2.4.4 F031 - Zone and conduit diagram

A diagram illustrating how systems and components in the system under consideration (SUC) are grouped into security zones and conduits, including at least the following information:

- illustration of each security zone, including its name and/or designation, security profile, and zone boundaries
- simplified illustration of each system in the security zones, including its name and/or designation and physical location on board
- illustration and designation of communication links and networks between systems in the same security zone
- illustration and designation of network communication between systems in different security zones (conduits)
- illustration and designation of network communication between systems in a security zone and untrusted networks (conduits).

2.4.5 F071 - Inventory list

Documentation specifying hardware and software components and include the information below.

For hardware devices (host devices, embedded devices, networks devices):

- brand and/or manufacturer
- model, type or name
- short description of functionality and purpose
- physical interfaces
- version and patch level of operating system or firmware
- supported communication protocols.

For software components (e.g. applications, utility software):

- designation of the hardware device in which the software is installed
- brand and/or manufacturer
- model, type or name
- short description of functionality and purpose
- version of software.

2.4.6 F141 - Configuration guidelines

Documentation describing recommended and default settings for all configurable security capabilities.

2.4.7 F142 - Cyber incident response and recovery manual

Documentation including procedures or instructions supporting response to and recovery from cyber incidents, covering the following:

- local independent control
- fail-to-safe state
- network isolation
- forensics by use of audit records
- backup and restore
- shutdown, reset, roll-back, and restart.

2.4.8 F200 - Cyber security documentation for systems

Documentation demonstrating compliance with cyber security requirements for a computer-based system.

For systems with type approved security capabilities, including the following documentation:
